There are many reasons why a cookie could not be set correctly. Below are the most common reasons:

- You have cookies disabled in your browser. You need to reset your browser to accept cookies or to ask you if you want to accept cookies.
- Your browser asks you whether you want to accept cookies and you declined. To accept cookies from this site, use the Back button and accept the cookie.
- Your browser does not support cookies. Try a different browser if you suspect this.
- The date on your computer is in the past. If your computer's clock shows a date before 1 Jan 1970, the browser will automatically forget the cookie. To fix this, set the correct time and date on your computer.
- You have installed an application that monitors or blocks cookies from being set. You must disable the application while logging in or check with your system administrator.

Why Does this Site Require Cookies?

This site uses cookies to improve performance by remembering that you are logged in when you go from page to page. To provide access without cookies would require the site to create a new session for every page you visit, which slows the system down to an unacceptable level.

What Gets Stored in a Cookie?

This site stores nothing other than an automatically generated session ID in the cookie; no other information is captured.

In general, only the information that you provide, or the choices you make while visiting a web site, can be stored in a cookie. For example, the site cannot determine your email name unless you choose to type it. Allowing a website to create a cookie does not give that or any other site access to the rest of your computer, and only the site that created the cookie can read it.

Aging occurs and people die because their bodies cease to be able to defend themselves against harmful organisms and toxins. In short, aging is not a simple problem. No matter what the people who try to sell longevity treatments tell you, there’s no one thing that causes aging; it’s a wide variety of things. A person who has cancer and dies at age 92 is still recorded as dying of cancer rather than of old age. In any case, if you eliminate disease, it has a significant effect on mortality rates and consequently on people’s expectations about their lives. In our lifetimes, however, technological change has been fast enough to cause social problems. People have a hard time adapting to the new technology, and in the worst cases, it results in unemployment.
